

FP2 - TIP 'O THE WEEK #34

INSTALLING OMNIS 4.1

The Next time you get a FirePro update, you will need to install Omnis 4.1 BEFORE you install the update.

The instructions for installing Omnis 4.1 will come with your update to FirePro version 69.0 or greater. If you want the update right away, let us know. Otherwise you will receive it the next time you are scheduled to receive an update.

To do this, you must **uninstall Omnis 3.3 first**. How? Select the uninstall option from your start up menu (Do this from the start menu rather than through your control panel):

Start → All Programs → Omnis Studio → Remove Omnis 3.3

If you don't do this, or didn't get it uninstalled correctly, you may have a problem opening FirePro with Omnis 4.1. If this is the case, you can fix it!

Go to:

Start → All Programs → Omnis Studio --> Omnis 4.1

Enter your serial # etc., and then go to:

File → Open Library

Find the file FirePro2 from your FirePro folder (this must be the new one sent to you at the same time as the Omnis installer).

Don't forget to backup your data file before opening it!

Now you should be able to close Firepro. Next, double click on your FirePro shortcut and it will open the program right up for you.

Quote of the week:

"It takes one eye opened to meet your true love, but both eyes closed to keep them"- Unknown
